

Project on introduction of Computer Assisted Diagnosis (CAD) on chest X-ray in Cambodia

- Chest X-rays are essential for the diagnosis of respiratory diseases and are widely used in Cambodia, but interpretation skills are still immature and there is a risk of missing disease.
- As part of Japan's support for response to the new coronavirus, FUJIFILM's "Computer Assisted Diagnosis (CAD) on chest X-ray" was introduced to two provincial hospitals supported by Japan.
- Since Cambodia's Ministry of Health has made DX one of the pillars of its next national health strategy, it is highly likely that CAD will continue to be included in Japan's support, and we will build knowledge for this purpose.
